

Question: write a function that takes in an array of non-empty distinct integers and a int  $\rightarrow$  targetSum

if any two numbers add up to targetSum, return them in array, if none, return empty array

Can't add number to itself, at most one pair.

e.g.

$\{ 3, 5, -4, 8, 11, 1, -1, 6 \}$ ,  $t = 10$

find  $x$  and  $y$ , such that  $x + y = t$

Brute force approach?  $\rightarrow$  not a good approach  
two for loops  $\rightarrow O(n^2)$

! use hash table

seen = {

}  $\rightarrow$  initialize empty hash table

$$x + y = 10$$

$$y = 10 - x \quad \rightarrow \text{currentNum} \quad \rightarrow \text{in traversing}$$

traverse the array, check if  $10 - x$ , which is number need to make the two sum pair, is in hash map, if yes return  $y$  and  $x$ , if not add it to hash map.

traverse the array (for loop):

$X = \text{CurrentNum} = \text{array}[i]$

if  $10 - \text{array}[i]$  is in  $\text{Seen\_hash}$ :

return  $[10 - \text{array}[i], \text{array}[i]]$

else:

$\text{seen\_hash}[\text{array}[i]] = \text{true}$

return  $[]$

Example run

$[3, 5, -4, 8, 11, 1, -1, 6]$ ,  $t = 10$

→  $\text{CurrentNum} = 3$

Does  $y = 10 - 3 = 7$  exist in array? no  
add to hash table

→  $\text{CurrentNum} = 5$

Does  $y = 10 - 5 = 5$  exist in array? no  
add to hash

→  $\text{CurrentNum} = -4$

$y = 10 - (-4) = 10 + 4 = 14$ ? no  
add

→  $\text{CurrentNum} = 8$

$y = 10 - 8 = 2$ ? no

→  $\text{CurrentNum} = 11$

$y = 10 - 11 = -1$ ? no

has-seen: { 3: true  
5: true  
-4: true  
8: true  
11: true  
1: true

}

→  $curr = 1$   
 $y = 10 - 1 = 9$  ? no

\* →  $currentNum = -1$   
 $y = 10 - (-1) = 11$  ? YES break out of loop

return  $[11, -1]$

time complexity →  $O(N)$    
 ↗ array traverse  
 ↘ hash map

space complexity →  $O(N)$

## 2nd Solution

- Sorting the array  $\rightarrow O(N \log(N))$

target = 10

$$\left[ -4, -1, 1, 3, 5, 6, 8, 11 \right]$$

$\begin{matrix} \nearrow & & \nwarrow \\ L & & R \end{matrix}$

$-4 + 11 = 7$   
 $7 < 10$

$$L + R = -4 + 11 = 7 \quad 7 \neq 10 \text{ ? no}$$

~~if~~  $> < 10$  :

$L = +1 \rightarrow$  move to the right

if  $> 0$  ;

$R = -1 \rightarrow$  move to the left

$$\rightarrow -1 + 11 = 10 \quad \checkmark$$

time complexity  $\rightarrow O(N \log(N))$

Space complexity  $\rightarrow O(1) \rightarrow$  if sorting can be done in place.
